Planning a new site this quarter?

# Don't lose the Google traffic you already earned.

- [ ] before launch
- [ ] launch day
- [ ] first weeks after

a migration checklist for SaaS founders → swipe

WHY TRAFFIC DROPS

# Google ranks URLs, not brands.

When an old URL disappears without a redirect, everything it earned (links, its place in search) has nowhere to go.

*the usual causes:*

- Old URLs return 404
- Every old page redirected to the homepage
- Content that ranked, cut in the redesign
- A stray noindex copied from staging

BEFORE LAUNCH · 1

# Map every URL first.

- [x] **Export every current URL**
  crawl + sitemap + Search Console
- [x] **Mark the pages that matter**
  trials, demos, backlinks
- [x] **Redirect each old URL to its closest new page**
  not to the homepage
- [x] **No redirect chains**
  old URL → final URL, one hop

BEFORE LAUNCH · 2

# Keep what made it rank.

- [x] **Keep the content that ranks**
  redesign around it, don't cut it

- [x] **Carry over titles, descriptions, H1s**
  + any structured data

- [x] **Benchmark speed on the old site**
  so you have a before and after

- [x] **Test every redirect on staging**
  one 301 → one 200

*put a name next to "remove staging noindex"*

LAUNCH DAY

# Ship the redirects with the site.

- [x] **Redirects live at server level**
  at the same time as the new site
- [x] **Staging noindex removed**
  and robots.txt allows crawling
- [x] **New sitemap submitted**
  in Google Search Console
- [x] **Sign-up, demo form and analytics fire**
  test them yourself

*rankings kept + broken form = customers still lost*

THE FIRST WEEKS AFTER

# Watch. Fix. Keep.

- [x] **Watch Search Console for new 404s**
  compare clicks page by page
- [x] **Redirect old URLs visitors still hit**
  emails, partner sites, docs
- [x] **Keep redirects for at least a year**
  Google's own guidance

## Rebuild on the roadmap?

Get a free video audit of your current site first. Full checklist on the blog.
